ABSTRACT OF THE DISCLOSURE

In a communication system, an access source page is printed, together with an entry column and code regions on a sheet of paper, the entry column being provided for entering a command content to access

5   destination pages, the code regions being provided for entering codes for specifying access destination pages corresponding to the entry column. Then, the sheet of paper on which the command content has been entered by a user is read. A URL of an access destination page corresponding to each entry column in which the command content has

10   been entered is specified on the basis of contents entered in the code regions, a link list or a text file. At least one command to the specified URL is specified on the basis of check-off states of check columns constituting each entry column. Then, at least one process corresponding to the command is applied to the URL.
